Art Unit: 2615

DETAILED ACTION

Response to Amendment

1. Applicant's arguments with respect to claims 1, 3, and 5-6 have been considered but are most in view of the new ground(s) of rejection.

Claim Rejections - 35 USC § 103

- 2. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 3. Claim 1, 15, 16, 18, 20, and 22 are rejected under 35 U.S.C. 103(a) as being unpatentable over Wactlar (5,825,667), and further in view of Kazami et al (6,035,093).

Regarding claim 1, Wactlar et al disclose an information storage medium for recording audio information and still image information recording (Col 16, lines 48-49 "the use of disk striping on disk arrays"):

- one or more music reproduction units for reproducing the audio information
 (Col 3, line 4 "audio can be played"); and
- set information for setting the still image information to represent contents of the first reproduction unit (Col 11, lines 66-67 "Each paragraph may be reasonably abstracted by a 'representative frame'"),
- wherein the set information is provided for at least one of the music reproduction units(Col 11, lines 66-67 "Each paragraph may be reasonably abstracted by a 'representative frame,'"), and

Art Unit: 2615

Wactlar suggests the still image information configured to be displayed first in
the music reproduction unit is set as the still image information being
representative of the contents of the music reproduction unit (Col 17, lines 5253 "image processing helped select representative still images for icons and
sequences from scenes"), but does not specifically disclose the automatic
selection of the first shown image as being the representative image.

Kazami teaches the use of the first image in a file as being a representative image (Col 1, lines 55-59 "The computer partially reads out the leading image from the selected image file, and generates a thumbnail image by reducing the pixel density of that leading image. The thumbnail image generated in this manner is displayed in a list with its associated file name").

As suggested by Wactlar and taught by Kazami, the selection of a first image as a representative image of a sequence of images is a well known method of providing a user with image information to aid in the selection of an image file. Therefore, it would have been obvious to modify Wactlar to select the image to be displayed first as a representative image of a file comprising a sequence of images.

Regarding claims 16 and 20, Wactlar discloses a method and apparatus for reproducing the audio information and the still information from the medium of claim 1 (Title, Method and apparatus for creating a searchable digital video library and a SYSTEM AND METHOD OF USING SUCH A LIBRARY").

Art Unit: 2615

Regarding claim 18, Wactlar discloses a method for recording the management information with respect to the still image information of the representative image on the medium of claim 1 (Abstract "steps of storing the indexed audio data and the digitized video data with their respective sets of time-stamps is also provided").

Page 4

Regarding claim 22, Wactlar discloses an apparatus for recording the audio information and the still image information on the medium of claim 1 (Abstract "storing the indexed audio data").

Regarding claim 15, Wactlar discloses a method for reproducing music information from an information storage medium which records audio information associated with a representative image (Col 3, line 4 "audio can be played" and Col 11, lines 66-67 "Each paragraph may be reasonably abstracted by a 'representative frame'"), still image information including the representative image (Col 17, line48 "Appearing on the screen are several icons"), and management information (Abstract "a first set of time-stamps"), the reproducing method comprising:

- reproducing the management information to search for the representative image (Col 5, lines 25-27 "The digital video library system provides fullcontent search of, and retrieval from, an on-line database"); and
- reproducing the audio information corresponding to the searched representative image (Col 17, lines 60-62 "The screen fills with a video of Arthur Clarke describing how he did not try to patent communications satellites").

Art Unit: 2615

 Wactlar suggests the still image information configured to be displayed first in a unit of music reproduction is being set as the representative image (Col 17, lines 52-53 "image processing helped select representative still images for icons and sequences from scenes"), but does not specifically disclose the automatic selection of the first shown image as being the representative image.

Kazami teaches the use of the first image in a file as being a representative image (Col 1, lines 55-59 "The computer partially reads out the leading image from the selected image file, and generates a thumbnail image by reducing the pixel density of that leading image. The thumbnail image generated in this manner is displayed in a list with its associated file name").

As suggested by Wactlar and taught by Kazami, the selection of a first image as a representative image of a sequence of images is a well known method of providing a user with image information to aid in the selection of an image file. Therefore, it would have been obvious to modify Wactlar to select the image to be displayed first as a representative image of a file comprising a sequence of images.

4. Claims 3, 17, 19, 21, and 23 are rejected under 35 U.S.C. 103(a) as being unpatentable by Maruyama et al (6,453,119), and in further view of Kazami et al (6,035,093).

Regarding claim 3, Maruyama et al disclose an information storage medium (Col 1, lines 11-12 an information recording medium") for recording audio (Col 33, lines

Art Unit: 2615

3-4 "Audio objects are contents... of audio data"), still image (Col 33, lines 1-3 "Picture objects are still picture information such as still pictures and slide pictures"), and one or more reproduction sequences for reproducing the audio information (Col 23, lines 31-33 "Program chain contents... indicate the number of programs and number of cells... in the program chain"), wherein, in at least one of the reproduction sequences, the still image

Page 6

information is configured to be displayed at the same time when the audio information is

reproduced (Col 9, lines 29-38 "Each video title set stores...audio data...and also

information for playing back these data"), the medium being configured to record:

- information for specifying or designating the still image information to represent contents of the reproduction sequence in which the still image information is to be displayed (Col 39, lines 16-17 "representative picture data can be used as a material for an icon")
- Maruyama et al suggest the still image information configured to be displayed
 first in the music reproduction unit is set as the still image information being
 representative of the contents of the music reproduction unit (Col 39, lines 1617 "representative picture data can be used as a material for an icon"), but
 does not specifically disclose the automatic selection of the first shown image
 as being the representative image.

Kazami teaches the use of the first image in a file as being a representative image (Col 1, lines 55-59 "The computer partially reads out the leading image from the selected image file, and generates a thumbnail image

Art Unit: 2615

by reducing the pixel density of that leading image. The thumbnail image generated in this manner is displayed in a list with its associated file name").

As suggested by Maruyama and taught by Kazami, the selection of a first image as a representative image of a sequence of images is a well known method of providing a user with image information to aid in the selection of an image file. Therefore, it would have been obvious to modify Maruyama to select the image to be displayed first as a representative image of a file comprising a sequence of images.

Regarding claims 17 and 21, Maruyama et al disclose a method for reproducing the audio information and the still image information from the medium of claim 3 (Col 1, lines 19-20 "an information playback method" and Col 33, lines 3-4 "Audio objects are contents... of audio data" and Col 33, lines 1-3 "Picture objects are still picture information such as still pictures and slide pictures").

Regarding claims 19, Maruyama et al disclose a method for recording the management information with respect to the still image information of the representative image on the medium of claim 3 (Col 1, lines 15-16 "an information recording method" and Col 23, lines 31-33 "Program chain contents... indicate the number of programs and number of cells... in the program chain" and Col 33, lines 1-3 "Picture objects are still picture information such as still pictures and slide pictures").

Regarding claim 23, Maruyama et al disclose an apparatus for recording the audio information and the still image information on the medium of claim 3 (Col 26, lines 27-28 "The disc drive unit that writes/reads [records/ plays back] information to/from

Art Unit: 2615

DVD disc" and Col 33, lines 3-4 "Audio objects are contents... of audio data" and Col 33, lines 1-3 "Picture objects are still picture information such as still pictures and slide pictures").

5. Claims 5 and 6 are rejected under 35 U.S.C. 103(a) as being unpatentable over Maruyama et al in further view of Kim et al (6,519,415).

Regarding claim 5, Maruyama et al disclose a method for setting a representative image, wherein the setting method uses an information storage medium for recording audio information, still image information, and management information indicative of a reproduction relationship between the audio information and the still image information (Col 39, lines 16-17 "representative picture data can be used as a material for an icon"), comprising:

- providing one or more music reproduction units for reproducing the audio information which includes first audio information managed in the music reproduction unit (Col 33, lines 3-4 "Audio objects are contents... of audio data");
- recording, in the management information, a still image being coincident with
 the representative image of contents of the first audio information before
 being divided, as a representative image of contents of the second audio
 information and as a representative image of contents of the third audio
 information (Col 39, lines 16-17 "representative picture data can be used as a
 material for an icon").

Art Unit: 2615

Although Maruyama suggests dividing the first audio information managed in
the music reproduction unit into second audio information and third audio
information (Col 2, lines 53-60 "a first area for storing...a plurality of
pictures... and a third area... for specifying a storage position of representative
picture data"), they do not specifically disclose the display of multiple pictures
during a single audio playback event.

Kim et al teach of the use of a plurality of pictures being displayed with the playing of an audio recording (Col 2, lines 26-29 "the method linked to the still pictures on a rewritable storage media includes recording obtained still pictures and/or audio signals which will be reproduced together with correspondent still pictures").

As suggested by Maruyama and taught by Kim, being able to play several still pictures in a single audio sequence would provide for a clean, continuous presentation that would not require user intervention to advance from one picture to the next. Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention to divide the audio information into a sequence of informations, each information associated with an individual still picture.

 Maruyama discloses a method for setting a representative image, wherein the second and third audio information can be used to reproduce music corresponding to the first audio information (Col 34, lines 57-61 "Program set 1402 consists of a set of a plurality of original cells=VOBs (video objects) 1403, 1404, and 1405 divided in accordance with the contents of audio & video data and the order of information recorded in AV file 1401").

Regarding claim 6, Maruyama et al disclose a method for setting a representative image, wherein the setting method uses an information storage medium for recording audio information, still image information, and management information indicative of a reproduction relationship between the audio information and the still image information (Col 39, lines 16-17 "representative picture data can be used as a material for an icon").

- Although Maruyama et al suggest providing one or more music reproduction units for reproducing the audio information which includes fourth audio information and fifth audio information managed in the one or more music reproduction units;
- combining the fourth audio information and the fifth audio information to form sixth audio information reproduced in the first reproduction unit; and
- recording in the management information, the representative image of
 contents of earlier-reproduced audio information, as a representative image of
 contents of the sixth audio information, wherein the earlier-reproduced audio
 information indicates one of the fourth audio information before combining
 and the fifth audio information before combining, which one is reproduced
 earlier than the other after being combined, and
- wherein the sixth audio information can be used to reproduce music
 corresponding to the fourth and fifth audio information (Col 2, lines 53-60 "a

Art Unit: 2615

first area for storing...a plurality of pictures...and a third area...for specifying a storage position of representative picture data"), they do not specifically disclose the display of multiple pictures during a single audio playback event.

Kim et al teach of the use of a plurality of pictures being displayed with the playing of an audio recording (Col 2, lines 26-29 "the method linked to the still pictures on a rewritable storage media includes recording obtained still pictures and/or audio signals which will be reproduced together with correspondent still pictures").

As suggested by Maruyama and taught by Kim, being able to play several still pictures in a single audio sequence would provide for a clean, continuous presentation that would not require user intervention to advance from one picture to the next. Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention to divide the audio information into a sequence of informations, each associated with an individual still picture.

Maruyama discloses a method for setting a representative image, wherein the fourth and fifth audio information can be used to reproduce music corresponding to the first audio information (Col 34, lines 57-61 "Program set 1402 consists of a set of a plurality of original cells=VOBs (video objects) 1403, 1404, and 1405 divided in accordance with the contents of audio & video data and the order of information recorded in AV file 1401").
